

Questions

1. The sales amount of each transaction is given. Visualize the probability distribution of sales values around their mean.
2. The number of orders placed per customer is recorded. Visualize the probability of a customer placing exactly x orders, where x ranges from 0–10.
3. The profit column is converted into profit/loss outcomes. Visualize the probability of making a profit vs. a loss in a single order.
4. Delivery times (in days) are recorded. Visualize the probability density of delivery times, focusing on values around the average delivery time.
5. Count the number of orders received each day. Visualize the probability of receiving exactly x orders in a day.
6. Consider whether a discount was given on an order (yes/no). Visualize the probability distribution of orders with and without discounts.
